PART 2 - Azure DevOps Git Setup

1.Create a Git Repo

PART 3 - Configure CI/CD Pipeline

Step-1: Select the Version control system (VCS) to continue. In my case it is Azure Repo Git.

Step-2: Select the respective repo at which the code, datasets are present. In my case it is present in HexaDevOps

Step-3: Then select python package to configure the pipeline.

Step-4: Ensure the YAML file configured properly

New pipeline

Review your pipeline YAML

Hexa-DevOps / azure-pipelines.yml *

```
1 trigger:
2   - main
3
4 pool:
5   vmImage: 'ubuntu-latest'
6
7 steps:
8   - task: UsePythonVersion@0
9     inputs:
10      versionSpec: '3.x'
11
12   - script: python src/app.py
13     displayName: 'Run Banking Application Placeholder'
14
```

Step-5: And then we can see the summary of the pipeline and it is scheduled to run with the configured agent.

The screenshot displays the Azure DevOps web interface. On the left is a sidebar with navigation links: Overview, Boards, Repos, Pipelines (selected), Environments, Library, Test Plans, and Artifacts. At the bottom of the sidebar is 'Project settings'. The main area is titled 'Pipelines' and has tabs for 'Recent', 'All', and 'Runs'. A 'New pipeline' button is in the top right. Below the tabs, a section titled 'Recently run pipelines' shows a table with one entry:

Pipeline	Last run
Hexa-DevOps	#20250829.1 • Set up CI with Azure Pipelines Individual CI for master 1h ago <1s
